SECTION C	
Case study based questions	<u> </u>
Section C consists of 10 questions of 1 mark each. Any 8 questions are to be attempted.	
Case Study -1	
Pacific Ring of Fire	

The Pacific Ring of Fire is a major area in the basin of the Pacific Ocean where many earthquakes and volcanic eruptions occur. In a large horseshoe shape, it is associated with a nearly continuous series of oceanic trenches, volcanic arcs, and volcanic belts and plate movements.

Fault Lines

Large faults within the Earth's crust result from the action of plate tectonic forces, with the largest forming the boundaries between the plates. Energy release associated with rapid movement on active faults is the cause of most earthquakes.

Positions of some countries in the Pacific ring of fire is shown in the square grid below.

	ROLLER COASTER POLYNOMIALS	
	Polynomials are everywhere. They play a key role in	
	the study of algebra, in analysis and on the whole	
	many mathematical problems involving them.	
	Since, polynomials are used to describe curves of	
	various types engineers use polynomials to graph	
	the curves of roller coasters.

	Based on the given information, answer the questions NO. 46-50.	
46	If the Roller Coaster is represented by the following graph y=p(x), then name the type of the	1
	polynomial it traces.
