**26** Let us assume 5 + 2√3 is rational, then it must be in the form of p/q where p and q are co-prime integers and q ≠ 0 1

i.e 5 + 2√3 = p/q ½

So $\sqrt{3} = \frac{p-5q}{2q}$……………………(i) ½

Since p, q, 5 and 2 are integers and q ≠ 0, HS of equation (i) is rational. But LHS of (i) is √3 which is irrational. This is not possible. ½

This contradiction has arisen due to our wrong assumption that 5 + 2√3 is rational. So, 5 + 2√3 is irrational. ½

**27** Let α and β be the zeros of the polynomial $2x^2 -5x -3$

Then α + β = 5/2 ½

And αβ = -3/2. ½

Let 2α and 2β be the zeros $x^2 + px + q$

Then 2α + 2β = -p ½

2(α + β) = -p

2 x 5/2 =-p

**So p = -5** ½

And 2α x 2β = q ½

4 αβ = q

So q = 4 x-3/2

= -6 ½

**28** Let the actual speed of the train be x km/hr and let the actual time taken be y hours. ½

Distance covered is xy km

If the speed is increased by 6 km/hr, then time of journey is reduced by 4 hours i.e., when speed is (x+6)km/hr, time of journey is (y−4) hours.

∴ Distance covered $=(x+6)(y-4)$

$\Rightarrow xy=(x+6)(y-4)$

$\Rightarrow -4x+6y-24=0$ ½

$\Rightarrow -2x+3y-12=0$ ……………………………..(i)

Similarly $xy=(x-6)(y+6)$

$\Rightarrow 6x-6y-36=0$

$\Rightarrow x-y-6=0$ ………………………………………(ii) ½

Solving (i) and (ii) we get x=30 and y=24 1

Putting the values of x and y in equation (i), we obtain

Distance $=(30\times24)$km $=720$km. ½

Hence, the length of the journey is 720km.

Let the number of chocolates in lot A be x ½

And let the number of chocolates in lot B be y

∴ total number of chocolates =x+y

Price of 1 chocolate = ₹ 2/3 , so for x chocolates $=\frac{2}{3}x$

and price of y chocolates at the rate of ₹ 1 per chocolate =y.

∴ by the given condition $\frac{2}{3}x+y=400$ ½

$\Rightarrow 2x+3y=1200$ ..............(i)

Similarly $x+\frac{4}{5}y=460$ ½

$\Rightarrow 5x+4y=2300$ ........ (ii)

Solving (i) and (ii) we get

x=300 and y=200

∴x+y=300+200=500 1

So, Anuj had 500 chocolates. ½

Let ABCD be the rhombus circumscribing the circle with centre O, such that AB, BC, CD and DA touch the circle at points P, Q, R and S respectively.
We know that the tangents drawn to a circle from an exterior point are equal in length.

∴ AP = AS…………(1)
BP = BQ……………(2)
CR = CQ …………...(3) 1
DR = DS……………(4).
Adding (1), (2), (3) and (4) we get
AP+BP+CR+DR = AS+BQ+CQ+DS
(AP+BP) + (CR+DR) = (AS+DS) + (BQ+CQ)
∴ AB+CD=AD+BC-----------(5) 1
Since AB=DC and AD=BC (opposite sides of parallelogram ABCD) ½
putting in (5) we get, 2AB=2AD
or AB = AD.
∴ AB=BC=DC=AD
Since a parallelogram with equal adjacent sides is a rhombus, so ABCD is a rhombus ½

**32** Let the time taken by larger pipe alone to fill the tank= x hours ½
Therefore, the time taken by the smaller pipe = x+10 hours

Water filled by larger pipe running for 4 hours = $\frac{4}{x}$ litres

Water filled by smaller pipe running for 9 hours = $\frac{9}{x+10}$ litres

Buy Recommended Sample Paper Books - https://bit.ly/3EoIPSf

We know that

$\frac{4}{x} + \frac{9}{x+10} = \frac{1}{2}$ 1

Which on simplification gives: 1

$x^2 - 16x - 80 = 0$

$x^2 - 20x + 4x - 80 = 0$

$x(x-20) + 4(x-20) = 0$

$(x+4)(x-20) = 0$

$x = -4, 20$ 1

x cannot be negative. ½

Thus, $x=20$ ½

$x+10 = 30$

Larger pipe would alone fill the tank in 20 hours and smaller pipe would fill the tank alone in 30 hours. ½

Let the usual speed of plane be x km/hr ½

and the reduced speed of the plane be (x-200) km/hr

Distance =600 km [Given]

According to the question,

(time taken at reduced speed) - (Schedule time) = 30 minutes = 0.5 hours.

1

$\frac{600}{x-200} - \frac{600}{x} = \frac{1}{2}$

Which on simplification gives: 1

$x^2 - 200x - 240000 = 0$

$x^2 - 600x + 400x - 240000 = 0$

$x(x-600) + 400(x-600) = 0$

$(x-600)(x+400) = 0$ 1

$x=600$ or $x=-400$ ½

But speed cannot be negative. ½

∴ The usual speed is 600 km/hr and ½

the scheduled duration of the flight is $\frac{600}{600}$ =1hour
